

$$\text{Loss} = \text{ERP error} + w \times \text{design recovery error} + 0.1 \times \text{padding error}$$

ERP error: mean squared error between the predicted and the true ERP

Design recovery error: difference between the design recovered from the true ERP and the true design

Padding error: how far the extra padded values are from zero (padded variants such as Q64)

w : weight that rises from 0.1 to 1 over the first 10 epochs
